Solution. Take the differential of the defining equation of the surface: $2zdz + 6xdx + 10ydy = 0$. Substitute the coordinates of the point (1,1,3): $6dz + 6dx + 10dy = 0$. This is the equation of the tangent plane, with the differentials replaced by the increments: $6(z-3) + 6(x-1) + 10(y-1) = 0$, or $6x + 10y + 6z = 22$.

Mathematics 2210 Calculus III Practice Final Examination

Calculus III Exams From the Spring of 2016. Exam 1: Vector-Valued Functions. Solution of Exam 1. Exam 2: Functions of Several Variables and Differentiation. Solution of Exam 2. Exam 3: Multiple Integrals. Solution of Exam 3. Exam 4: Vector Calculus.

Calculus III: Sample Exam Files

Solution: We have $f_x = 3x^2(x^2 + y^2) + (x^3 + y^4)(2x)(x^2 + y^2)^2$ and $f_y = 4y^3(x^2 + y^2) + (x^3 + y^4)(2y)(x^2 + y^2)^2$. By the continuity theorems f_x and f_y are both continuous for all $(x, y) \neq (0, 0)$, hence f is differentiable for all $(x, y) \neq (0, 0)$.

Don't show me this again. Welcome! This is one of over 2,200 courses on OCW. Find materials for this course in the pages linked along the left. MIT OpenCourseWare is a free & open publication of material from thousands of MIT courses, covering the entire MIT curriculum.. No enrollment or registration.

Final Exam | Final Exam | Multivariable Calculus ...

SOLUTION: We first find a general formula for the slope using the chain rule, and then evaluate at $t = 1$, giving $\frac{dy}{dx} \Big|_{t=1} = \frac{dy}{dt} \frac{dt}{dx} \Big|_{t=1} = 3t \cdot 2t + 6t = 17$. Since $x(1) = 4$ and $y(1) = 0$, we need the formula for a line with slope $1/7$ that passes through $(4,0)$. This equation is $y = \frac{1}{7}(x - 4)$. (3 points) Compute $\frac{d^2y}{dx^2}$ at $t = 1$.

FINAL EXAM CALCULUS 2 - Department of Mathematics

Calculus: Early Transcendentals 6e, Volume 2 (6th Edition) by James Stewart. Customized version for University of Massachusetts-Amherst. Engage Learning, 2008. Calculus I {Sample Final exam Solutions [1] Compute the following integrals: (a) $\int \frac{4}{x^2} dx$ $\int \ln^2(x) dx$ Solution. Substituting $u = \ln x$, $\int \frac{4}{x^2} dx = -\frac{4}{x} + C$ $\int \ln^2(x) dx = \int u^2 du = \frac{1}{3}u^3 = \frac{1}{3}\ln^3(x)$. Taking common denominator, using properties of the logarithm, one can get the answer in the more compact form $\int \frac{4}{x^2} dx = -\frac{4}{x} + \frac{1}{3}\ln^3(x)$. (b) $\int \sin(2x) dx = -\frac{1}{2}\cos(2x) + C$...

Calculus I {Sample Final exam - Florida Atlantic University

The Final Exam is scheduled in room Math109, Mathematics Building, on Monday May 11 at 10:30 am. The Final Exam is comprehensive of Chapter 9-10-11-12-13. The exams consists of 12 multiple choice questions and 4 essay questions, and it should be completed in 2 hours and 30 mins.
